Podcast Episode

Physicists develop microlens with earth-shatteringly short focal length

Filed under: Digital Cameras, Misc. Gadgets!

The science behind the discovery is probably only digestible by those that understand rocket science, but the long of short of it is this: the research shows that it is possible to create smaller, ultra-compact infrared optical components that can be integrated into existing semiconductor technologies while not sacrificing image quality. Now that's something even the layman can appreciate.
